Configuration instructions

- Pipeline Setup for Data Import

Pipeline Setup for Data Import

1. **Document the Data Import Pipeline**:
   Outline the steps required to set up the data import pipeline.
2. **Identify Missing Workers**:
   Compile a list of workers that are not included in the current implementation.
3. **Determine Appropriate Module**:
   Identify the module where each worker should be located.
   - If the necessary module does not exist, create a new one.
4. **Define State File Format**:
   Specify the state file format that each worker should operate with.
5. **Evaluate Existing Options**:
   Determine if the current options are sufficient to complete the scenario.
   - If not, additional development of the `generate-state` function is required.
6. **Update Vault (if applicable)**:
   - If Vault is used, add the necessary data to Vault.
7. **Create Input Files for the Pipeline**:
   Generate input files for the pipeline, considering the missing workers.
8. **Run State Generator for the First Input File**:
   Execute the state generator on the first input file.
9. **Reach Missing Worker via Workflow Manager**:
   - Proceed to the missing worker by running the workflow manager.
10. **Create Worker Stub for Payload Display**:
    - Develop a stub for the worker to display the payload.
11. **Write Missing Worker Script**:
    Develop the script for the missing worker.
12. **Run Workflow Manager Post-Debugging**:
    - After debugging, restart the workflow manager.
13. **Create Production Input Files**:
    - Create input files for production (daily and historical data).
14. **Set Up Cron Job for Daily Tasks**:
    - Schedule the daily tasks using a cron job (pending update to version 1.9.0).
